

question 1

```
sal = float(input("Enter salary: "))
years = int(input("Enter years of service: "))

if years < 2:
    bonus = 0
elif years <= 5:
    bonus = sal * 0.05
elif years <= 10:
    bonus = sal * 0.10
else:
    bonus = sal* 0.15

print("Bonus Amount =", bonus)
```

```
Enter salary: 2500
Enter years of service: 4
Bonus Amount = 125.0
```

question 2

```
age = int(input("Enter age: "))
show = input("Enter show type (matinee/evening): ")

if age < 12:
    price = 5

elif age <= 17:
    if show == "matinee":
        price = 7
    else:
        price = 10

elif age <= 60:
    if show == "matinee":
        price = 10
    else:
        price = 14

else:
    price = 6

print(f"Ticket Price = {price} $")
```

```
Enter age: 45
Enter show type (matinee/evening): evening
Ticket Price = 14 $
```

question 3

```
temp = float(input("Enter temperature (°C): "))

if temp < 15:
    print("Cold Alert")
    print("Action: Increase heating.")

elif temp <= 25:
    print("Normal")
    print("Action: No action required.")

elif temp <= 40:
    print("Warning")
    print("Action: Monitor temperature.")

else:
    print("Critical Alert")
    print("Action: Stop operations immediately.")
```

```
Enter temperature (°C): 34
Warning
Action: Monitor temperature.
```

question 4

```
credit = int(input("Enter credit score: "))
debt = float(input("Enter debt ratio (%): "))

if credit < 600:
    print("Loan Rejected")

elif credit <= 699:
    if debt < 30:
        print("Loan Approved")
    else:
        print("Loan Rejected")

elif credit <= 749:
    if debt < 40:
        print("Loan Approved")
    else:
        print("Loan Rejected")

else:
    if debt < 50:
        print("Loan Approved")
    else:
        print("Loan Rejected")
```

Enter credit score: 650
Enter debt ratio (%): 23
Loan Approved

question 5

```
score = int(input("Enter score: "))
attendance = int(input("Enter attendance (%): "))

if score >= 90 and attendance >= 90:
    print("Excellent")

elif score >= 80 and attendance >= 80:
    print("Good")

elif score >= 70 and attendance >= 70:
    print("Satisfactory")

elif score >= 60 and attendance >= 60:
    print("Average")

else:
    print("Failed")
```

Enter score: 78
Enter attendance (%): 90
Satisfactory

question 6

```
team = int(input("Enter team size: "))
budget = float(input("Enter annual budget: "))

if team >= 1 and team <= 5 and budget < 500:
    print("Starter")

elif team >= 6 and team <= 20 and budget >= 500 and budget <= 2000:
    print("Professional")

elif team >= 21 and team <= 50 and budget >= 2000 and budget <= 5000:
    print("Enterprise")

elif team > 50 and budget >= 5000:
    print("Premium")

else:
    print("No suitable plan")
```

Enter team size: 7
Enter annual budget: 4500
No suitable plan

question 7

```
weight = float(input("Enter weight (kg): "))
value = float(input("Enter order value: "))
```

```

value = float(input("Enter order value: "))

if weight < 1:
    if value >= 50:
        cost = 0
    else:
        cost = 5

elif weight <= 5:
    if value >= 100:
        cost = 8
    else:
        cost = 12

elif weight <= 10:
    cost = 15

else:
    cost = 25 + (weight - 10) * 2

print("Shipping Cost = $", cost)

```

Enter weight (kg): 12
Enter order value: 2
Shipping Cost = \$ 29.0

question 8

```

bmi = float(input("Enter BMI: "))
bp = int(input("Enter Blood Pressure: "))
chol = int(input("Enter Cholesterol: "))

levels = ["Underweight", "Healthy", "Overweight", "Obese", "Severely Obese"]

if bmi < 18.5:
    risk = 0
elif bmi < 25:
    risk = 1
elif bmi < 30:
    risk = 2
elif bmi < 35:
    risk = 3
else:
    risk = 4

if bp > 140 or chol > 200:
    if risk < 4:
        risk += 1

print("Final Health Risk:", levels[risk])

```

Enter BMI: 28
Enter Blood Pressure: 120
Enter Cholesterol: 156
Final Health Risk: Overweight

```

vehicle = input("Enter vehicle type (motorcycle/car/suv): ")
hours = int(input("Enter parking hours: "))
